

Fig. 2. Possible introgressed Golden-winged Warbler migrant of 2 Sep 2001. Indicators are the yellow wash in the breast and the fore-supercilium cut off by the gold crown meeting the lores.

Fig. 1 A-D. Four hybrid variants resulting from crosses and backcrosses between introgressed Blue-winged Warblers and their hybrids.

A. Rare introgressed Blue-winged Warbler breeding female of 17 Jun 1984 with large spiked lores and narrow white wing bars.

B. Rare Brewster's Warbler variant breeding female of 8 May (recaptured 4 Jun 1989 with nesting material) with trace of black in chin and throat, yellow wing bars, and yellow underparts with white mixed in sides.

C. Rare introgressed Blue-winged Warbler variant breeding male of 27 May 1990 (recaptured 12 Jun 1994) with black lower eye ring and partial ear patch and wide white wing bars with yellow tips.

D. Introgressed Blue-winged Warbler post-breeding male of 17 Aug 2008 with yellow tips to the white wing bars, eye arc (not always present), and widening of the lores into small downward pointing spikes in front of the eyes.
